

## Advanced Field Operations & Scoring Coordinator User Manual

---

**System Deployment:** Production Environment Guide

**Audience:** Event Directors, Lead Scorekeepers, and AV Production Technicians

**Operational Release:** 2026 Field Standard

# 1. Tournament Initialization Workflow

---

To ensure structural schedule integrity, initialization must follow a rigid administrative sequence. Failure to input parameters in this precise order may restrict generation capability.

## Step 1: Team Registration & Roster Ingestion

Navigate to the  **Setup** control node. Register all participating assets using the right-hand panel:

- Input the explicit number ID inside the Team # field.
- Input the formal team moniker inside the Team Name field.
- Click + Add to push to the local state register.
- *Alternative:* Click Load Samples to execute immediate baseline layout injection for validation testing.

## Step 2: Configuration Constraints

Locate the **Event Setup** administrative panel card on the left side of the layout area:

- Define the formal user-facing tournament name descriptor in the Event Name text input field.
- Specify the allocation value for target qualification matches per team within the numeric entry input field.
- Commit the configurations to active local state memory by clicking the ✓ Save command button.

## Step 3: Schedule Processing

Once team thresholds are validated, choose one of the following compilation methods:

- **Automated Synthesis:** Click the green  Generate action node. This uses the core engine to compile a balanced schedule matching the specified target values.
- **External Batch Import:** For pre-calculated configurations, enter comma-separated values into the multi-line input textarea block following the specific syntax: red1, red2, blue1, blue2. Click  Import to map the rows into active match queue entries.

## 2. Field Queue & Match Control Operations

---

The operational lifecycle of a match relies on pushing values safely between sequential workflow states through the  Queue interface tab.

### | 2.1 The Match Operational Lifecycle

Matches flow through four main lifecycle states during a tournament:

1. **Pending Status:** All newly processed schedule rows begin as un-executed queue items. They sit sequentially waiting for action within the primary list box.
2. **On Deck Block:** The immediate next match is positioned automatically within the predictive secondary box container, allowing field crew to pre-stage crews and equipment.
3. **On Field Active State:** Clicking a specific entry's green  Call button pulls that match from the waitlist into active state focus, immediately loading its telemetry data across the scoreboard link.
4. **Completed Status:** Once field personnel submit the final verified scoring matrix, the match state shifts to finalized, removing it from queue routines and calculating team statistics.

**Advanced Operator Override (Skip Mechanism):** If an alliance team experiences sudden structural or technical issues, click the curved arrow  Skip button. This action shifts that specific match entry directly to the end of the tournament queue sequence without breaking its data constraints, preventing field idle time.

## 3. Real-Time Arena Scoring Procedures

---

The scoring workflow operates across specialized sections inside the scoring interface tab, separating evaluation matrices cleanly to ensure scoring accuracy.

### | 3.1 Operational Control Scoring Sections

When a match is running on the field, the operator uses the  Score tab to input real-time alliance achievements across three distinct phases:

- **Autonomous Phase Scoring:** Tracks items completed during the initial autonomous operational block. Points scored during this period carry an increased point multiplier weight.
- **Teleoperated Phase Scoring:** Tracks driver-controlled actions performed by team operators during standard live gameplay. This phase covers core scoring tasks and cycle activities.
- **End-Game Phase Scoring:** Focuses on actions completed during the final seconds of the match. Points emphasize high-value parking, climbing, or field-locking objectives.

## 3.2 Real-Time Interface Elements

The interface uses interactive components designed for quick and accurate data entry during fast gameplay loops:

- **Increment/Decrement Click Counters:** Numeric values use button pairs (- and +) encircling a central tally marker. Click to modify item counts instantly.
- **Binary Operational Toggles:** True/False milestone conditions use styled slide-toggle components. Shifting to green records successful achievement validation.

## 4. Live Scoreboard Broadcasting Mechanics

The production interface controls arena screens and projectors through the dedicated  **Scoreboard** management window layout.

### 4.1 Extended Display Setup Pipeline

To route the scoreboard broadcast to arena displays, follow this deployment workflow:

1. Connect the computer's secondary video out port to the arena display matrix or projector network. Configure the operating system's display parameters to **Extend Desktop Mode**.
2. Inside Harvest Havoc, navigate to the  **Scoreboard** tab and click the purple  **Open Scoreboard Window** button.
3. Drag the newly opened browser window viewport onto the extended arena display screen. Press the F11 function key to lock the window into borderless fullscreen layout.

### 4.2 Scoreboard State Routing Table

The software switches display modes to match tournament activities. Technicians use manual buttons to cycle through four display layouts:

| Operational State                                                                                       | Arena Audience Display Layout                                                                 | Recommended Production Context                                                         |
|---------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
|  <b>Pre-Match</b>      | Displays large team identification labels, color banners, and alliance pairing rosters.       | Activate when teams are setting up equipment on the field prior to the official start. |
|  <b>Live Match</b>     | Displays a prominent countdown timer alongside real-time scoring bars for both alliances.     | Activate when the head referee starts the official match execution loop.               |
|  <b>Splash Overlay</b> | Triggers a full-screen graphic celebration display featuring pulsing colors and victory text. | Activate the instant the final score is verified to highlight the match winners.       |
|  <b>Post-Match</b>     | Displays a detailed analytical score breakdown, final rankings, and total tournament points.  | Activate after score submission to review historical performance data.                 |
